Summary

Pre-final year Information Technology student at Pune Institute of Computer Technology focused on backend engineering, Data Structures & Algorithms, and scalable system design. Experienced in building REST APIs with Spring Boot, working with relational and NoSQL databases, and applying OOP and design patterns to write clean, maintainable, and efficient code.

Education

SCRT's Pune Institute of Computer Technology

B.Tech in Information Technology — CGPA: 9.55

Class XII (2024): 93.67% Class X (2022): 93.20%

Sep 2024 – July 2028

Pune, Maharashtra

Skills

Languages: Java, C++

CS Fundamentals: Data Structures & Algorithms, OOP, Design Patterns

Backend: Spring Boot, REST APIs, System Design Basics

Databases: MySQL, MongoDB, Redis

Tools: Git, GitHub, Postman,

Projects

Studio Oak (studio-oak-frontend.onrender.com)

- Built a full-stack e-commerce platform supporting product browsing, ordering, and user management.
- Implemented inventory checks and stock updates to avoid overselling during multiple orders.
- Tested authentication, order, and inventory flows against invalid inputs and edge cases.
- Designed modular APIs and components to simplify maintenance and future improvements.

Distributed Rate Limiter (Spring Boot)

- Built a distributed API rate limiter using Spring Boot and Redis to protect backend services from traffic spikes and abuse.
- Implemented Token Bucket, Sliding Window, and Fixed Window algorithms using the Strategy design pattern with shared Redis state.
- Developed a Spring interceptor to enforce per-client limits, returning HTTP 429 and Retry-After headers with configurable algorithm selection.
- Benchmarked rate-limiting algorithms using k6 under burst traffic, evaluating throughput, fairness, and latency trade-offs.

Experience

Admission Counseling Intern

June 2025 – September 2025

GanitAnk (Remote)

- Supported 150+ students in the admission process by analyzing requirements and providing structured college recommendations.
- Identified inefficiencies in manual workflows and developed a Python-based solution to automate college list generation using predefined templates.
- Reduced processing time by approximately 60% while improving consistency and presentation of reports for faster information delivery.

Achievements & Certifications

- **Winner – IEEE Techrush Hackathon:** Built a MERN-based e-commerce solution under time constraints.
- **J.P. Morgan Software Engineering Job Simulation:** Worked on interface improvements and financial data visualization tasks.
- Designed and deployed an NGO website to improve online visibility and support community outreach efforts.
